

Welcome to Construct-A-Slab

The floor slab is arguably the most important part of a building. It is the platform on which all operations take place. Designed and constructed properly, the building owner should not even notice it's there. However, many concrete floors are beset with problems such as:

- Poor surface tolerance
- Inadequate joint performance
- Low abrasion resistance
- Cracking
- And more...

Expensive remedials and repairs can rectify many of these defects. Designed and constructed right the first time through, saves you money and time.

Most buildings, whether used for manufacturing, storage and distribution, retail or leisure facilities, have a concrete floor slab. The successful construction of this floor results from an integrated planning and construction process that focusses on the needs of the owner/user.

A key part of this process is a design brief and performance based specification. It is critical that the finished concrete slab is tested against this specification. Only then, can the owner/user be sure that floor will perform as designed and be sure that what was promised has been delivered.

Construction methods and materials continue to evolve rapidly allowing quality to be achieved at realistic prices. The cheapest price does not mean the lowest cost. The Construct-A-Slab alliance brings together a wealth of experience from four leading players in the field of floor slab construction. Operating on a global basis, each can offer advice and guidance to ensure that from design to completion, the floor owner/user is 100% satisfied.
